For this assignment we were instructed to create a complex functionality using switches and LEDs. Since I am having issues with my ESP32, this assignment was quite difficult for me to complete. I used Tinkercad to mimic a real Arduino Uno. Although my code was simple, the process of creating it helped me understand the hardware immensely better. My LED display consists of 5 lights (red, orange, yellow, green, and blue). When the code is run, the lights light up and turn off one by one.
